

REMARKS

The Examiner has rejected Applicants' claim as obvious over the teachings of the patent to Kaspar '957. The Kaspar patent utilizes electrically conductive attachment bolts (reference numeral 5) for mounting the mirror drive unit on the support for adjustment. Applicants newly submitted base article and method claims now recite the invention as having the mirror housing formed as one piece with electrically conductive reinforcements insert molded therein. This feature of Applicants' construction yields improved structural rigidity and economies of manufacturing which is neither taught nor suggested by the cited references. Accordingly, it is submitted that the newly submitted claims define patentable subject matter; and, it is therefore requested that the Examiner's rejection be withdrawn and the newly presented claims made the subject of a Notice of Allowance.

Respectfully submitted,

Roger A. Johnston
